

ABSTRACT OF THE DISCLOSURE

A window regulator control switch includes a rear view mirror selector adjustable in left and right positions to adjust the rear view mirrors. A control button enables or disables a rear door function, such as a child safety function or the locking of a local window regulator. The control button enables or disables the rear door function for the left-hand or right-hand rear door depending on the position of the selector. The selector also has a neutral position in which action on the control button enables or disables the rear door function for the rear doors. The switch allows for flexibility of the controls without proportionally increasing the number of buttons.
